\mathbf{Log}

Table 1: A log of each flight test conducted by our team. Autonomous flight time is listed in bold under the total time.

Date (m-d-y)	Location	Total Auto (min)	Takeoffs/ Landings Auto	Notes
10-16-18	Springville	<1	1/0	Networking issues, later determined to be because of location. Moving down the road works. Attempted RC flight and crashed on launch. Need to practice launch procedure.
10-19-18	Springville	<1	1/0	Attempted RC flight for imaging. RC lost upon launch. Later determined to be because of the RC antenna not being installed. Aircraft did not have a balanced center of gravity (CG) and so performed a loop and crash landed.
10-23-18	Springville	1	1/0	Attempted RC flight for imaging. Aircraft had major longitudinal stability issues. Later determined to be because of a negative static margin. Moving the battery forward fixes issue. Lost control and crashed. Transmitter also dying very very quickly. Later determined to be transmission power set to high (1 A changed to 10 mA).
11-01-18	Springville	3	1/0	Attempted RC flight for imaging. Still had minor stability issues. We lost control and crash landed near end of flight. We later determined these issues were because the battery was not secured properly. It slid around inflight affecting our static margin. This caused instability and aggressive flight maneuvers that caused the battery to fall out in flight. As such we lost control and crashed. Battery must be strapped down.

11-06-18	Springville	5	1/0	Attempted RC flight for imaging. Aircraft flew wonderfully. Images of ground targets successfully captured. Flight was terminated when RC was lost and aircraft crashed hard. More investigation into the cause is needed. Possibly because of RC interference over the trees or to low of transmission power.
12-11-18	Rock Canyon	1	1/0	First flight test of new aircraft. Performed a glide test and found the aircraft performed well. With slight longitudinal instability. We moved the cg forward by adding a 500 g weight. This proved too much as the aircraft was notably nose heavy the next flight attempt which was forced to landed immediately upon takeoff. With an inexperienced pilot, we found this preferable to instability and attempted a second flight. The aircraft still dropped on takeoff but stable flight was obtained. This lasted 45 seconds before the pilot lost control and crashed. While pilot error likely played a part in this crash, we later determined that wind from the canyon was a large factor.
1-11-19	Rock Canyon	6	1/1	First fully successful flight. Set trims. We also decided to add colored tape to the wings to increase the visibility of the aircraft in flight.
1-18-19	Rock Canyon	4	1/1	Very windy, probably shouldn't have attempted flight but we had not yet figured out the wind problem from the canyon. Adjusted trims.

1-23-19	Rock Canyon	14	2/2	Performed two flights both of which were successful. Several minor repairs (general maintenance) were necessary after this flight. This flight test proved the aircraft was flyable and stable with all of the weight that will be on the aircraft during the competition. We tested both the weight with and without the UGV. Trimmed aircraft with and without UGV
1-20-19	Canyon	11	2/2	weight. Transferred these trims to ROS-flight. 2 flights. Additional tape on wing provided sufficient visibility.
1-31-19	Utah County Airfield	7	1/1	Intended to test autopilot and begin tuning gains. Could not successfully turn on autopilot. Later this was determined to be because we were incorrectly following the process to hand over control to the autopilot. We flew once manually to test the gains. Small adjustments were made and transferred to ROSflight.
2-2-19	Utah County Airfield	24 1	2/2	Two flights to tune gains on autopilot. The autopilot had a tendency to flip the aircraft upside down immediately after turning on the autopilot. This was determined to not be caused by the gains. Aircraft landed safely manually both flights. After a couple of days of testing we found the cause was that the number being used to convert rad to PWM for the ailerons was negative. This effectively reversed the aileron polarity. Last year the wires must have been swapped from how we have them now.

2-6-19	Utah County Airfield	17 4	2/2	Two flights to tune gains on autopilot. Flipping issue was fixed. Aircraft dove towards the ground upon turning on autopilot. This was fixed between flights (rad to PWM conversion for the elevator was negative this time) and we achieved autonomous flight the second attempt. We then tuned the longitudinal PID gains. Aircraft landed safely manually both flights.
2-6-19	Utah County Airfield	31 10	1/1	Tuned longitudinal gains and made a small effort to tune lateral gains. We also attempted a loiter, but aircraft was not tuned well enough to do so. Used course following to perfect the gains. Finished the longitudinal gains and got lateral gains reasonable. Next step is attempting a loiter and waypoints to tune lateral gains.
2-19-19	Rock Canyon	3	1/1	Short flight to test cargo drop. Payload dropped upon command and the parachute opened successfully.
2-26-19	Rock Canyon	10	3/3	Three more flights to test payload drop. Payload successfully dropped two out of the three times. During the second test, the payload door got stuck on some tape we added between flights and the payload didn't fall out until a full minute after it was commanded. We removed this tape and the aircraft performed nominally on the third flight. We also used this flight to get realistic images to test the vision algorithm on. The camera was installed and images save on the odroid.

3-5-19	Utah County Airfield	10	1/1	Miss communication on what code was on the aircraft inhibited our ability to test the control algorithms. As such we will put in place protocol for changing code on the aircraft (see AF-014) Aquired imaging data.
3-25-19	Utah County Airfield	0	0/0	During preflight check we experienced RC brown outs. Other RC pilots at the airfield experienced a similar problem, which caused us to think interference might be the cause. We did not risk a flight. In the lab, we were able to replicate the problem. It seemed to be caused by a poor wire connection between the RC transmitter and the amplification packet attached to it. Further discussion with the other RC pilots indicated that they thought their issue had to do with a loss of propulsion. These two facts seem to indicate that it was not actually an interference issue, but instead a hardware issue. We fixed the loose connection and it seemed to solve the problem.
3-27-19	Utah County Airfield	28 9	3/2 0/1	Three flights. Dropped payload successfully twice. Flew 3 waypoints and landed autonomously.
4-1-19	Utah County Airfield	4	1/0	Safety pilot accidentally disarmed the plane while trying to transition to the autopilot. This caused loss of power, and, after this was realized, it was too late to save the aircraft from crashing. Aircraft landed in a bush and was mostly saved.

4-2-19	Utah	0	0/0	During preflight checks we could not
	County		,	achieve wireless communication between
	Airfield			the flight computer and ground station.
	& Rock			We found that the Ubiquity bullet never
	Canyon			connected to the light beam antenna.
				We spent over an hour attempting to
				solve the problem. We tried moving the
				aircraft a few feet (which had worked
				in the past), replacing wires that might
				have been bad, and scanning for inter-
				ference. We rebooted the system after
				each attempt to fix the problem. Noth-
				ing worked. Eventually we gave up and
				left. On the drive back we decided to try
				again at Rock Canyon park. Of course,
				at Rock Canyon, the wireless signal con-
				nected on the first try. Issues such as this
				were observed earlier in the year, but are
				not repeatable and occur so infrequently
				that we can not get to the root of the
				problem. We still have no clue what the
				issue is or how to solve it. It seems to be
				simultaneously location and time depen-
				dent.

Canyon didn't not started fly tonomous the RC sign entered a mode). Trecover the nal was specraft. This aircraft was could not nal. It see we did ge once, the tentionally cur freque ging. We the issue it tween the packet), so	red RC signal brown outs. We betice this until after we had ying. Small amounts of ausifight were achieved. Because agnal dropped out, the aircraft loiter successfully (it's failure. The safety pilot then tried to be aircraft and, because RC signotty, could not control the aircis caused a crash in a tree. The reas still mostly flyable, but we find the bug in the RC signems to occur randomly. While the it to occur on the ground problem in general is not interpretable and does not occently enough for easy debugse have some guesses to what is (again poor connection between transmitter and amplification of are currently using the guess a method to try to solve this is-
